Sakriya — counting people, not accounts: a usage-data governance, targeting and accountability layer for Jan Dhan

India @71/100 Challenge · Theme 3: Financial Inclusion & Meaningful Banking Access · Round 1 proposal (DRAFT v0.2, 4 Oct 2026)

1. Problem identification

India's scorecard says inclusion is rising. PMJDY accounts grew from 42.20 crore (March 2021) to 59.09 crore (August 2026) [P1, P4], and the RBI Financial Inclusion Index reached 70.0 in March 2026, a rise RBI attributes "mainly" to an "uptick in Usage" [P6]. The administrative record says otherwise: **inoperative PMJDY accounts — no customer-induced transaction for two years — rose from 5.94 crore (14.1%, March 2021) to 15.09 crore (26.4%, Lok Sabha answer of 8 December 2025)** [P1, P3]. Accounts grew 35%; inoperative accounts grew 154%.

The World Bank's survey tells a third story: Indian adults with an *inactive* account fell from 27.4% (2021) to 14.3% (2024) [P7]. The lenses disagree because the State counts **accounts, not people** — someone may use one account while an old Jan Dhan account lapses — and no one can tell which. Both agree on **who is left behind**: in 2024, 19.6% of women account owners had an inactive account against 12.6% of men, and 23.2% of the poorest 40% against 11.6% of the richest 60% [P7, derived]. Yet the Ministry of Finance told Parliament that inoperative accounts by gender and by rural/semi-urban area, accounts holding under ₹500, and credit to PMJDY holders are **"not centrally maintained"** [P1, P3].

Gap. One Jan Dhan account in four is inoperative and the share is rising; one woman account owner in five has not used her account in a year; and the data that could find, reach and count these people — bank ledgers, DBT credits, Business Correspondent (BC) networks — is not governed to do so. **Community:** women, the poorest and less-educated account holders, mostly in the rural and semi-urban areas that hold 77.8% of Jan Dhan accounts [P4, P7].

2. Evidence and context

Indicator	Value	Source
PMJDY accounts (women)	59.09 crore (32.92 crore), 19 Aug 2026; 45.95 crore rural/semi-urban	[P4]
Deposits; RuPay cards	₹3,16,514 crore; 41.29 crore cards (19 Aug 2026)	[P4]
Inoperative PMJDY accounts	5.94 → 6.57 → 9.45 → 10.21 → 11.94 crore (Mar 2021–Mar 2025) → 13.05 (Jul 2025) → 15.09 crore (Dec 2025)	[P1–P3]
Inoperative share by state (31 Jul 2025)	12.5% (Lakshadweep) to 39.0% (Goa); among the 16 states with > 1 crore accounts, 16.3% (West Bengal) to 32.5% (Telangana); Uttar Pradesh 2.75 crore (27.5%)	[P2], our parse
RBI FI-Index	64.2 (Mar 2024) → 67.0 (Mar 2025) → 70.0 (Mar 2026)	[P5, P6]
Adults with an inactive account	27.4% (2021) → 14.3% (2024); of owners in 2024: women 19.6%, men 12.6%, poorest 40% 23.2%	[P7]
Overdraft availed	35.99 lakh holders (≈ 0.6% of accounts), Mar 2025	[P1]

Indicator	Value	Source
"Not centrally maintained"	inoperative by gender and area, balance ranges, accounts < ₹500, credit to PMJDY holders	[P1, P3]

The rise continued through a nationwide Gram Panchayat saturation campaign (1 July – 30 September 2025) that targeted re-KYC of inactive PMJDY accounts [P1, P2]. The two Parliament answers word the definition differently, so part of the late-2025 jump may be definitional — itself a governance problem.

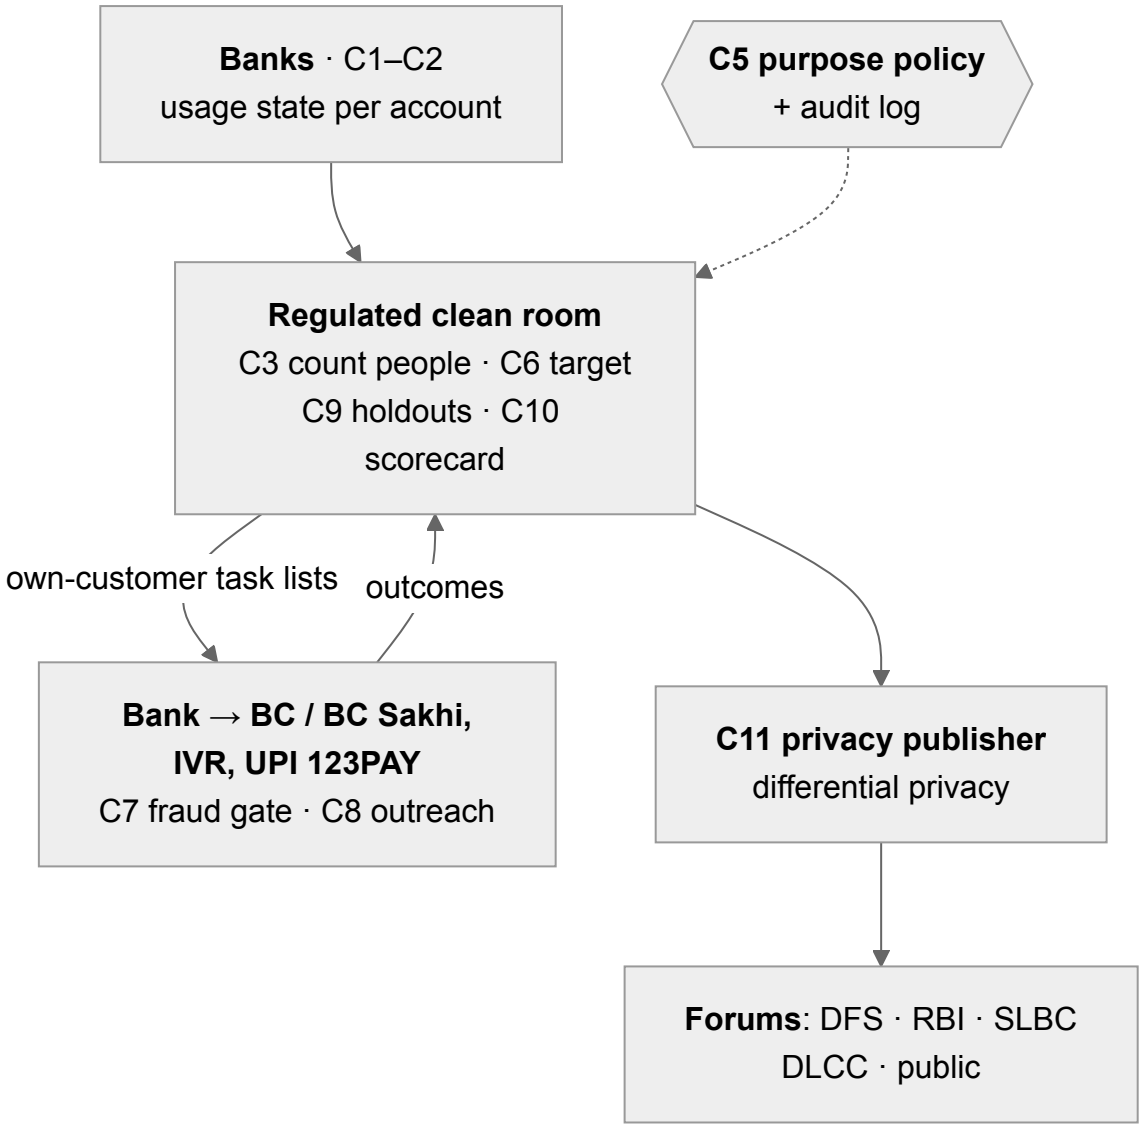

3. Existing ecosystem and why the gap persists

What exists. Zero-balance accounts with RuPay card, accident cover and overdraft [P4]; DBT credited "even to the inactive accounts" [P2]; RBI's revised inoperative-account rules in force since April 2024 — annual review, alerts a year ahead, tracing of holders, KYC at any branch or by video, no activation charges, monitoring of reactivated accounts [P8]; unclaimed balances to RBI's DEA Fund after ten years [P3]; saturation campaigns and 2,421 Centres for Financial Literacy [P1]; feature-phone payments through UPI 123PAY (IVR, missed call, app, sound) [P10]; Account Aggregator consent rails with 310 million+ accounts linked [P11]; and the national FI-Index [P6]. BCs, AePS and the NPCI mapper for Aadhaar-based DBT carry the last mile (citations pending).

Why the gap persists — failures of data governance, not of rails: 1. **The official flag is not a usage measure.** "Inoperative" is a fraud-control status, and accounts opened for DBT or scholarships are deliberately exempted from it [P8] — unused DBT accounts can be invisible, and an account emptied the day DBT lands counts as "operative". 2. **Counting accounts, not people; enrolment, not use.** Forums review openings and totals; breakdowns by person, gender or area do not exist centrally [P1, P3]. 3. **Blanket outreach.** Alerts and campaigns go to every dormant account [P2, P8]; visits are spent on duplicates, migrants and the deceased while persuadable holders get a generic SMS. 4. **Reactivation friction.** Fresh KYC at a branch or by video [P8] is hard for the people who stopped coming. 5. **No feedback loop.** No one measures which outreach changed behaviour for whom, so programmes cannot learn and implementers cannot be credited or held to account. 6. **Unclear sharing rules.** Usage, DBT and identity data sit with banks, NPCI and departments under the DPDP Act 2023 and Aadhaar law; without an agreed pattern each keeps its silo.

4. Proposed solution — Sakriya

Sakriya (सक्रिय, "active") is a **data-governance and decision layer on existing rails — no new financial product**. It (a) measures meaningful usage *per person*, (b) decides who gets which outreach to maximise *incremental* usage per rupee, (c) measures what worked, and (d) publishes usage-based accountability tables to the forums that already review inclusion, with privacy built into every flow. Fourteen components sit behind typed contracts; two are the innovation spikes.

4.1 Usage state, not "operative" (C1–C2). Each bank computes monthly, inside its own systems, a standard record per account — customer-induced transactions by channel, DBT credits and how fast they are withdrawn, balance, KYC status, insurance and pension enrolment — and a published rule set assigns one of five states (*inoperative, dormant-risk, DBT pass-through, basic, meaningful*) with a 0–100 Meaningful Usage Score. Token credits never count as use; anyone can recompute any state.

4.2 Count people, not accounts (C3–C5). In a regulated confidential-computing clean room, accounts are linked to *purpose-scoped pseudonyms* (keyed hashes of an identity reference, never the Aadhaar number); tokens issued for targeting cannot be joined with tokens issued for statistics. A policy engine decides every request by role × purpose × data × granularity × legal basis and writes a hash-chained audit entry.

Data	Bank and its BC	Clean room	DFS · RBI · SLBC · DLCC	Public
Ledger, KYC status	Own customers	Encrypted features	Never	Never
Person usage state, target list	Own customers, with reason codes	Purpose-bound, deleted after use	Never	Never

Data	Bank and its BC	Clean room	DFS · RBI · SLBC · DLCC	Public
Usage rates, gender gaps, effects	Own units	Computed	Differentially private, with CIs	State level

4.3 Targeting engine (spike A, C6). For each person and outreach arm — local-language IVR/SMS, BC or BC Sakhi visit with doorstep re-KYC, assisted UPI 123PAY onboarding, a small first-use incentive — the engine estimates the *incremental* probability of meaningful use over six months and allocates arms to maximise total gain within a rupee budget, with a floor on the share of women and a cap on tasks per BC. Every plan keeps a 10% randomised holdout, and a learned allocation is used only where it beats simple rules on held-out pilot data. A fraud gate (C7) adds verification before reactivating accounts at risk of mule use.

4.4 Learning and accountability (spike B, C9–C11). Holdouts give unbiased monthly effects by arm, segment and implementer. The **usage scorecard** reports for each district, bank, branch and BC: persons in meaningful use, inoperative persons, the gender gap, and the implementer's *incremental* usage with a confidence interval, plus gaming flags (token credits, reactivate-then-lapse, account churn). A differential-privacy publisher with a privacy-budget ledger feeds existing forums: DFS/RBI nationally (beside the FI-Index), SLBCs, District Consultative Committees and Lead District Managers, banks and BCs for their own units, and a public state page. "Accounts opened" targets become **"people actively banking" targets**.

4.5 What the working skeleton shows. End to end on a SYNTHETIC population calibrated to the official 23% inoperative share, at the same budget (₹10 per eligible person), held-out persons, 3 seeds:

Policy	Share of achievable gain	Extra persons in meaningful use (per ~11,500)
Status quo: BC visits to inoperative, then dormant, then pass-through accounts	0.04 ± 0.00	47
Highest "risk of non-use" first	−0.07 ± 0.01	18
Best average arm (IVR) to everyone	0.37 ± 0.01	134
Sakriya v0.1 (uplift, shrunk; women ≥ their share)	0.33 ± 0.02	126
Oracle (true effects)	1.00	300

Share of achievable gain = (policy − random) / (oracle − random). Reproduce: python eval/rebaseline_c6.py exp1 0.5. Dormancy-first outreach wastes most of the budget and risk ranking is worse than random: **dormancy is not persuadability**. Our first learner does not yet beat the simple best-arm rule — hence the rule that a learned policy must win on held-out data before use. On a real 64,000-person randomised e-mail experiment [P9] (retail, not banking), the same learner beat "best message to a random subset" by 2.5–3.2 responses per 1,000 when only 10–20% could be contacted (CIs include zero in two of three splits) but lost at full coverage: target *who* when contacts are scarce — as for 15 crore inoperative accounts — and personalise *which* intervention cautiously.

5. Feasibility and implementation roadmap

Owners, within existing mandates. DFS (PMJDY mission) sponsors; RBI sets usage-state definitions alongside its inoperative-account and KYC directions and oversees the clean room; NPCI issues identity-reference tokens and runs UPI 123PAY/AePS; banks run C1–C2 and outreach through their BCs; SLBCs and the Lead Bank Scheme review scorecards in existing meetings; the DBT Mission supplies credit metadata; DAY-NRLM provides BC Sakhis.

Plan. *Months 0–3:* publish the usage-state rules and contracts; run C1–C2 on one bank's history inside the bank; legal review of the governance matrix (DPDP Act, Aadhaar law). *Months 3–9:* one-district randomised pilot (two to three banks, BC Sakhi presence, high inoperative share): targeting engine vs blanket outreach in randomised blocks; primary outcome persons in meaningful use at six months; secondary cost per incremental active person, women's share, fraud incidents. *Months 9–18:* state scale-up through the SLBC; scorecards on DCC/SLBC agendas; public DP page. *Months 18–36:* national — NSFI monitoring adds person-level usage by district and gender beside the FI-Index.

Feasibility and risks. A district plan runs on a laptop in minutes in our skeleton; banks already hold every input; outreach uses existing BC commissions and IVR; clean rooms and differential privacy are mature techniques. Risks and mitigations: legal basis for linkage (purpose-scoped tokens, minimisation, person lists only inside the bank, legal review first); opacity (published rules, reason codes, simple-rule fallback); exclusion by targeting (women's floor, holdouts, grievance channel); gaming (customer-induced definitions, persistence, gaming flags, comparison units); fraud on reactivation (C7).

6. Expected impact and scalability

Beneficiaries: the people behind 15.09 crore inoperative accounts and the DBT pass-through users — mostly rural women and the poorest. **Outcomes:** more people (not accounts) in sustained use at lower cost per reactivated user; gender and district breakdowns that are "not centrally maintained" today become routine, privacy-preserving statistics; implementers are reviewed on usage. **KPIs:** persons in meaningful use by district and gender; inoperative persons; incremental users per ₹ lakh of outreach; women's share of incremental users; DBT pass-through share; fraud per lakh reactivations; data latency ≤ 10 days after month-end. **Scale:** every component runs on systems and forums that already exist nationally, so scaling is a matter of standards and adoption, not new infrastructure. Impact will be measured from the pilot's randomised design, not the simulator.
