DustLedger — presenter card (Delhi zonal, 10 min)

Open: zonal-deck.pdf on your own laptop · demo/dustledger-demo.html in a second tab (offline) · backups B1–B8 after slide 9 · team fields on slide 1 filled in · this card printed.

#	Time	Slide	Land this line
1	0:00–0:20	Title	"Rules follow the activity and the stage, not each site's dust."
2	0:20–1:00	Restrictions	Reported plan: Nov 1 – Jan 31 restricted; Dec 10 – Jan 20 ban; GRAP-3 16 days in 2025.
3	1:00–1:45	Monitors & fines	47 monitors at city scale; fines ₹1 lakh to ₹2 lakh by area; checklists, not dust.
4	1:45–2:35	Small source	Construction = 2-5% of ambient PM10 (IIT Kanpur, 2013–14 data); 1,378,199 workers on the rolls.
5	2:35–3:15	Tools fall short	A fence sensor mostly measures Delhi's background.
6	3:15–4:45	DustLedger	Downwind − upwind = an estimate, not proof; "inconclusive" below 0.5 m/s, never clean.
7	4:45–6:15	Stress test	All hours 57.4 vs 64.9; work hours no better; fewer false alarms. **SIMULATED.**
8	6:15–7:15	Cost & power	Parts ₹60,711 (parts only); 10.2 Wh/day (model estimate).
9	7:15–8:45	Test plan & ask	Approval-dependent; controlled test is never "field validation". Ask: site · co-location · DPCC contact.
—	8:45–10:00	Reserve	Stop. Take questions.

Three numbers to remember: ₹60,711 of parts per site · 57.4 vs 64.9 µg/m³ all-hours (simulated; no better in work hours) · construction = 2-5% of ambient PM10 in IIT Kanpur's study.

Never say: tamper-proof · "we will cut AQI by …" · "clean sites can keep working" (it's a proposal) · "no one else does this" · "field-validated".

Fast answers (full list: qa-prep.md)

- *Why you, in a crowded theme?* Others measure the city; we estimate which site added the dust — and say "inconclusive" when we can't tell.
- *Built or simulated?* Data pipeline, forecast benchmark, demo: built. Sites + sensors in the replay: simulated. Ring + misting: Round 2.
- *Sensors aren't accurate for dust.* Agreed (CSTEP 2025: qualitative). Side-by-side, reference co-location and a blind known-source test come first; DPCC verifies before fines.
- *Calm winds?* Below 0.5 m/s → "inconclusive". Site-level calm hasn't been measured yet; we'll report the abstention rate.
- *Only a few per cent of PM — why bother?* Because that source is restricted citywide; an evidence tool targets inspection. No city-AQI claim.
- *Trial during the restrictions?* Real site only before 1 Nov with approvals; otherwise an approved controlled test, reported as such.
