JalSakshi — presenter card (Delhi zonal, 10 Oct 2026, 10 min)

Before you go on: present from **your own laptop**. Open **`zonal-deck.pdf` first**, with `demo/jalsakshi-demo.html` in a second browser tab (works offline). Charger, HDMI/USB-C adapter, phone timer set to 9:30.

Opening line (0:00): *"Delhi has made rainwater harvesting compulsory for 25 years and pays rebates for it. Today, checking a pit means an inspector's visit. We propose storm-by-storm evidence. The software and simulation are built; the field instrument is our Round-2 build."*

Say these three numbers, exactly this way:

1. **13 %**: median per-storm error on our stress test (simulation). *"3 % is only when our models agree, so we don't sell that."*
2. **₹11,166 per node** in verified retail parts, vs ≈ ₹38,000 for one CGWA-compliant logger (Acorn) that logs twice a day.
3. **733 million litres a year**: the campaign's *estimate* (Indian Express). *"That's the number we'd audit."*

Never say: "aquifer recharge" · "self-certification is the rule" (it's *planned*) · "never checked" / "doesn't exist" · "first buyer" · "pre-registered" · "± band" (planned) · a battery life · "we detect illegal borewells".

Clock	You should be at	Cue
1:40	end of slide 2 (the rule)	"Nothing measures a pit storm by storm. We add that layer, alongside inspection."
2:30	end of slide 3 (why now)	"The campaign's 733 M L/yr is an estimate. We'd audit it."
4:00	end of slide 4 (solution)	switch to the pre-opened demo tab
5:15	demo done	**space** to play; **2×** if behind; 🔌 **Unplug rain gauge** → "deferred"; fallback = slide 5 image
6:15	end of slide 6 (accuracy)	"13 %, and a blind rig test in November."
8:00	end of slide 8 (cost, prospective customer)	"Prospective pilot customer: DJB's restoration programme. No contact yet."
9:15	close of slide 9	"Measured, not self-declared." (45 s reserve)

Demo cues (45 s):

1. Left panel: "185 stations, only 46 reported this year, a quarter of readings exactly zero."
2. Press **space**: "Simulated pit, Delhi's real 2025 rain. Every storm gets a verdict."
3. At the red band: "A rise the rain can't explain: random inspection, not a penalty."
4. At the end: "Drain rate below half: a maintenance ticket."

Five hardest questions:

1. *"A level sensor isn't recharge."* Right. We report the drain rate (the core: maintenance screening) and a model-based infiltrated-volume estimate. A leak out of the pit looks like infiltration, so suspicious cases go to inspection. A per-event band is planned.
2. *"3 % grades your own simulator."* Yes, so we lead with 13 % (14.5 % with a realistic probe), over 1,233 scored event windows. The real number comes from blind weighed-water tests in November.
3. *"Who pays if the owner can lose the rebate?"* Not households first. Our prospective pilot customer is DJB's restoration programme (59 empanelled providers); no contact yet, that's our ask. Inspectors override; no bill changes automatically.
4. *"Can an owner cheat?"* Yes: a bypass during real rain, or a small or slow pour. A 20 L bucket isn't even an event. Large sudden pulses the rain can't explain are flagged (10/10 simulated, 500–2,000 L) → random inspection.
5. *"Battery life?"* Not claimed until measured. Probe settle time decides D-cell vs solar; we measure it in October.

If the panel cuts you to 5 minutes: slide 1 (10 s) → 2 (60 s) → 4 (60 s) → 5 demo (45 s) → 6 (40 s) → 8 (40 s) → 9 (15 s). Skip 3 and 7, and mention the WRIS finding in one line during the demo.
